Level 4 → Level 5: Identifying Human-Readable Files

Objective: Find the human-readable file among several files in the inhere directory.

Commands used:

cd inhere
ls -la
file ./*
cat <matching-filename>

Procedure:

1. Logged in using the bandit4 account.
2. Navigated to the directory containing multiple files.
3. Used the file command to identify the type of each file.
4. Determined which file contained human-readable text.
5. Displayed the contents of the matching file to obtain the password.

Result: Identified the appropriate text file and retrieved the next password.

Concept learned: The file command examines file contents and metadata to identify the likely file type. File extensions alone are not always reliable indicators of file content.
