Level 10 → Level 11: Decoding Base64 Data

Objective: Decode the Base64-encoded data stored in data.txt.

Command used:
base64 -d data.txt

Procedure:

1. Logged in using the bandit10 account.
2. Located the data.txt file.
3. Used the base64 utility with the -d option to decode the file contents.
4. Read the decoded output.
5. Recorded the password for the bandit11 account.

Result: Successfully decoded the Base64 data and obtained the next level's password.

Concept learned: Base64 is a data-encoding scheme that represents binary data using printable characters. The -d option decodes Base64 input. Base64 is not encryption and does not provide confidentiality.
